Looking at the relationship between COVID-19 and long-term inequality in developing countries. Research on how Covid-19 affects long-term inequality in developing countries suggests that a link exists between them. In South Africa, a country with significant income disparities, research has explored the impact of housing insecurity and access to adequate housing. Studies have also looked at perceptions of economic inequality, social identity, and its influence on responses to such issues. The International Monetary Fund has noted persistent and multifaceted inequality in South Africa through six key charts. Furthermore, a study found that gender inequality was associated with higher levels of sexual violence. Additionally, there is a connection between perceptions of economic inequality and the views people have about what it means to be a "real" man in South African society. National Development Plan, released by the National Planning Commission in 2011, outlines a framework for South Africa's development. More recent studies have explored risk factors for alcohol and drug misuse among young women in informal settlements in Durban, as well as income inequality's impact on life satisfaction and violence against women. Statistics South Africa has published various reports on inequality trends, including the multidimensional diagnostic of inequality and the Sustainable Development Goals country report. A 2022 report highlights the labour market's favourability to men over women. Scholarly articles have examined the relationship between spatial inequalities and policies in South Africa, as well as the role of corruption perception indexes. The United Nations has published goals and progress charts for reducing inequality within and among countries. Examining how young females in South Africa's informal areas perceive love and coping with abusive relationships. Page numbers: 1225-1239, Vol. 21, Issue 11, 2019.
